

Operations Reliability Intern

At Apple, we don't just follow industry standards—we push beyond them. We value creative problem-solving, dynamic thinking, and the ability to quickly adapt to new technical challenges. If you're excited about tackling tough problems and shaping the future of amazing products, we'd love to have you on board!

In this role, you'll collaborate with diverse teams to ensure our products are not only durable and reliable, but also built to exceed expectations.

Responsibilities:

- Drive contract manufacturer for ORT testing & FA readiness
- Analyse & interpret reliability dataset to improve testing, data capture and failure analysis methodologies & efficiency.
- Develop a centralised tool showing tester availability, utilisation and unit tracking in ORT lab across all sites at few clicks.
- ORT WIP Simulation & auto scheduling
- Simulate field product usage models during the mass production stage based on physics of failure, product usage behaviour & feedback to reliability test plan.
- Perform assignments in several of the following -
- Reliability test planning: Develop new reliability test procedures, create detailed test plans, and analyze results to assess design & process risks
- Failure Analysis: Support failure analysis to derive a root cause
- Data Analytics: Build new data platforms to identify high-risk failure modes early in the design life cycle and find the best path toward mitigation before ramp.

Education:

- BE/B.Tech in a related Engineering discipline like Mechanical/Industrial/Manufacturing/Electrical/Electronics Engineering

Additional Requirements:

- A deep understanding of material and device properties (mechanical, electrical, optical, thermal) and the underlying physics
- Familiarity with Six sigma methodology, distribution analysis, accelerated models & JMP
- Knowledge of AI based tools & models
