

About the Role

Responsive is looking for a product-minded Associate Software Engineer with strong technical fundamentals and a passion for building scalable, intelligent solutions. This role is open to fresh graduates as well as candidates with up to 2 years of experience.

We are looking for candidates who have built a strong foundation through academic projects, internships, personal projects, hackathons, open-source contributions, or professional experience, particularly in Java, Large Language Models (LLMs), Retrieval-Augmented Generation (RAG), AI Agents, and modern search technologies.

What You'll Be Doing

- **Software Development:** Design, develop, test, and maintain Responsive applications with a focus on performance, scalability, reliability, and maintainability.
- **AI-Powered Application Development:** Build and enhance intelligent product capabilities using LLMs, RAG, AI Agents, semantic search, and Generative AI technologies.
- **Search & Retrieval:** Develop search and retrieval capabilities involving embeddings, vector search, semantic search, hybrid retrieval, and retrieval pipelines.
- **Performance Tuning:** Analyze and optimize application performance, addressing bottlenecks and ensuring low-latency query and retrieval responses.
- **Collaboration:** Work closely with cross-functional and geographically distributed teams, including product managers, frontend engineers, backend engineers, and UX designers, to deliver seamless product experiences.
- **Continuous Learning & Innovation:** Keep up with advancements in software engineering, Generative AI, LLMs, RAG, Agents, and search technologies, and apply them through research, experimentation, and prototyping.

What We're Looking For

Education:

- Bachelor's degree in Computer Science, Information Technology, or a related field.

Experience:

- 0–2 years of software development experience.
- Professional experience is not mandatory. Relevant experience may come from internships, academic projects, personal projects, hackathons, or open-source contributions.
- Candidates should be able to demonstrate hands-on knowledge through projects or practical implementation of relevant technologies.

Skills, Qualifications & Ability:

- Strong foundation in **Java** programming, object-oriented programming, data structures, algorithms, and server-side development.
- Understanding of **Java design patterns** and writing clean, maintainable, and testable code.
- Familiarity with technologies such as **Spring/Spring Boot, React, MongoDB**, or similar frontend/backend technologies.
- Understanding of **Large Language Models (LLMs)** and their use in building Generative AI applications.
- Hands-on knowledge of **Retrieval-Augmented Generation (RAG)** concepts, including document ingestion, chunking, embeddings, retrieval, context construction, and LLM-based response generation.
- Understanding of **AI Agents and agentic workflows**, including concepts such as tool/function calling, orchestration, multi-step workflows, and connecting LLMs with external systems and APIs.
- Familiarity with **prompt engineering**, LLM APIs, grounding, model evaluation, and techniques for reducing hallucinations.
- Understanding of **embeddings, vector databases/vector search**, semantic search, and hybrid search.
- Familiarity with search technologies such as **Elasticsearch, Apache Solr**, or similar platforms.
- Exposure to **Natural Language Processing (NLP)**, information retrieval, text processing, and AI-powered search.
- Familiarity with frameworks such as **LangChain, LlamaIndex**, Semantic Kernel, or equivalent GenAI frameworks is a plus.
- Familiarity with cloud platforms such as **GCP, Azure, or AWS**, including cloud-native services for application development, AI/ML, data storage, and processing.
- Understanding of **Test-Driven Development (TDD)**, unit testing, and software engineering best practices.
- Strong **problem-solving, analytical, and debugging skills**, with curiosity and enthusiasm for learning emerging technologies.

What Can Help You Stand Out

For fresh graduates, we value demonstrated ability over years of professional experience. Candidates who can showcase projects involving one or more of the following will have an advantage:

- A working RAG application built using an LLM, embeddings, and a vector/search database.
- An AI Agent that uses tools, APIs, or external data sources to complete tasks.
- Applications built using Java and Spring Boot with well-designed APIs and backend architecture.
- Practical experimentation with LLMs, prompt engineering, evaluation, or GenAI frameworks.
- Contributions to open-source projects, hackathons, technical competitions, or relevant internships.
